## List of locally significant pest vegetation species managed under the NALL

The *Biosecurity Act 2014* authorises the use of local laws by Councils to manage species not declared in the Act that pose a risk to the biodiversity values of a region. The following list comprise those species identified as having potential detrimental impacts in Brisbane that are priorities for management through local laws.

In executing its powers in relation to the species included on this list, Council recognises and adopts the methodology for targeted invasive species management described in section 10 of this Plan. Consequently, the management and enforcement of the pest vegetation list will reflect the potential that a non-native species poses at a property level.

In some instances, the pest vegetation included in this list comprise ornamental plants and species that are iconic species in Brisbane. For instance, Jacarandas contribute to the landscape character of the city and are protected in some places, but they are a non-native species that have the potential to invade our natural areas and waterways. Consequently, the NALL will be applied to manage listed species in a discretionary way at a site level, where pest vegetation poses a risk to natural areas.

For more information on the pest vegetation managed through local laws, please visit Council's website, and search for 'pest vegetation'.
